

windPRO

Hybrid webinar

The HYBRID module evaluates the financial feasibility of combining electricity prices with different energy technologies like wind and solar.

In this webinar you will see how you can increase income by consuming power behind-the-meter or use storage to meet demands at times with low production.

Additionally, we will introduce the optimizer tool for identifying the right balance between wind and PV capacities including cases with grid export limitations.

The import/export functionalities between 3rd party tools and our own energyPRO will be shown.

Keywords: Hybrid solutions, sizing, optimization, LCOE, Batteries (BESS), grid limitation, spot market
